Q5 → Consider a program That uses a fork() To create Child process.
Parent have variable x with value 5
 $\therefore X = 5$

After forking, both The value increment X by 1.

Final value of x after The call.

pa

~~for parent~~ Parent Process.

→ initial $X = 5$
increment $X + 1 = 6$ Now.

Then X become $= 6$
y become $= 6$
